TITLE : LIQUID CRYSTAL DISPLAY DEVICE

ABSTRACT : PROBLEM TO BE SOLVED: To provide a liq. crystal display device capable of easily exchanging a polarizing plate member.

SOLUTION: This device 51 is constituted by arranging a LCD panel 52 between polarizing plate members 53 and 54 including a polarizer and the polarizing plate members 53 and 54 are independently arranged. Light from a light source lamp 55 is made incident on a light scattering plate 57 and the polarizing plate 54 directly or guided by a light transmission plate 56 and becomes a linearly polarized light. The same light is made incident on the LCD panel 52 arranged with space on the upper side of the polarizing plate member 54 and becomes an elliptically polarized light. The same light is made incident on the polarizing plate member 53 arranged on the LCD panel 52 and becomes a linearly polarized light. These members are covered by an upper and lower bezel 59 and 58. The polarizing plate members 53, 54 are constituted with a polarizer arranged between two transparent resin plates and further include a phase difference plate. The transparent resin plate is a non-axial resin plate having no property polarizing light. And an antidazzle processing is applied on a surface of the polarizing plate member 53 in a displaying face side.
